## REPORT

MA-4601 "Structural Investigation of Novel Ternary Hydrides - Near Room-temperature Superconductors"

> Dmitrii Semenok, Anna Ivanova, Ivan Troyan

## Research goals

Within this proposal, we planned to study the crystal structure of ternary superconducting hydrides: $\mathrm{La}-\mathrm{Y}-\mathrm{H}, \mathrm{Mg}-\mathrm{Y}-$ $\mathrm{H}, \mathrm{Ca}-\mathrm{Y}-\mathrm{H}$. We expected that the crystal structure of these ternary polyhydrides will be determined for the first time. We planned to confirm formation of cubic $\mathrm{CaYH}_{12}, \mathrm{LaYH}_{12}$ and $\mathrm{Y}_{x} \mathrm{Mg}_{1-x} \mathrm{H}_{6}$, as well as non-stoichiometric ternary hydrides, in accordance with the results of computer modelling.

## Results

Diamond anvil cells (DACs) loaded by ( $\mathrm{Mg}, \mathrm{Y}$ )-H and ( $\mathrm{Ca}, \mathrm{Y}$ )-H samples were broken during laser heating or a few days later, before its sending to ESRF. Four DACs loaded by $\mathrm{La}_{\mathrm{x}} \mathrm{Y}_{(1-\mathrm{x})}-\mathrm{H}$ turned to be more stable and crashed only after the one day of XRD measurements at the ID15B beamline. Four measured DACs (named M1, M2, SL1 and SL3) had the following parameters:

| DAC | Pressure, $\mathbf{G P a}$ | Sample size, $\boldsymbol{\mu m}$ | Sample |
| :---: | :---: | :---: | :---: |
| M1 | 180 | 30 | ${\mathrm{LaY} / \mathrm{BH}_{3} \mathrm{NH}_{3}}^{\text {M2 }}$ |
| M2 | 180 | 32 | $\mathrm{La}_{2}{\mathrm{Y} / \mathrm{BH}_{3} \mathrm{NH}_{3}}^{\text {SL1 }}$ |
| SL3 | 180 | 29 | $\mathrm{La}_{4}{\mathrm{Y} / \mathrm{BH}_{3} \mathrm{NH}_{3}}^{2}$ |

The La-Y alloys for the loading of DACs were prepared by an arc melting (2000-2500 ${ }^{\circ} \mathrm{C}, 10$ seconds) of $\mathrm{La} / \mathrm{Y}$ pellets in Ar atmosphere at pressure of 6 bar. According to the results of scanning electron microscopy (SEM), Xray diffraction and energy-dispersive analysis (EDX), the obtained alloys consisted of hcp-La4Y (SL1), hcp-La ${ }_{2} \mathrm{Y}$ (M2) and mixtures of $\mathrm{La}_{2} \mathrm{Y}+\mathrm{Y}_{2} \mathrm{La}(\mathrm{M} 1)$ and $\mathrm{La}_{2} \mathrm{Y}+\mathrm{Y}_{2} \mathrm{La}+\mathrm{Y}$ (SL3).

Pulsed laser heating of $\mathrm{La} / \mathrm{Y}$ micro samples, taken from obtained $\mathrm{La} / \mathrm{Y}$ alloys and mixed with $\mathrm{NH}_{3} \mathrm{BH}_{3}$, was carried out at 1500-2000 K with duration of several microseconds. After the heating the La/Y particles expanded, became black, and the pressure in DACs, measured via both Raman signals of diamond and hydrogen, dropped to $180 \pm 2$ GPa (M1, M2, SL1) and $170 \pm 2 \mathrm{GPa}$ (SL3).

Figure 1. (Left) Le Bail refinement of the unit cell parameters of $F m-3 m$-(La, Y$) \mathrm{H}_{10}$ sample in M2 DAC. (Right) LeBail refinement of the cell parameters of $\mathrm{Fm}-3 m-(\mathrm{La}, \mathrm{Y}) \mathrm{H}_{10}, \mathrm{Imm}^{2}-\mathrm{YH}_{7}$ and $\mathrm{Cmcm}-\mathrm{LaH}_{3}$ (M1 DAC).

Results of the synthesis were examined through powder X-ray diffraction of synchrotron radiation, wavelength of $0.4111 \AA$, at the ID15B ESRF beamline (Figure 1). In all 4 cells the main phase was Fm - $3 m$-( $\mathrm{La}, \mathrm{Y}$ ) $\mathrm{H}_{10}$ with a cell volume by $0.5-0.83 \AA^{3}$ lower than the cell volume of $\mathrm{Fm}-3 m-\mathrm{LaH}_{10}$ at $170-180 \mathrm{GPa}$, respectively. This corresponds to the sample composition of $\mathrm{La}_{3} \mathrm{YH}_{40}$ or $\mathrm{La}_{0.75} \mathrm{Y}_{0.25} \mathrm{H}_{10}$, which is close to the loaded one (M2, SL1). The cleanest samples were in the DACs SL1 and M2, while in M1 and SL3 we have detected previously described impurities: pseudocubic $\mathrm{Imm} 2-\mathrm{YH}_{7}$ (Figure 1, right chart) and, probably, $\mathrm{Cmcm}^{2}-\mathrm{LaH}_{3}$ (Figure 2).

Figure 2. (left) Le Bail refinement of the unit cell parameters of $\operatorname{Fm}-3 m-(\mathrm{La}, \mathrm{Y}) \mathrm{H}_{10}$ sample in SL1. (Right) Le Bail refinement of the cell parameters of $F m-3 m-(\mathrm{La}, \mathrm{Y}) \mathrm{H}_{10}, \mathrm{Imm} 2-\mathrm{YH}_{7}$ and Cmcm- $\mathrm{LaH}_{3}$ phases in SL3 DAC.

Experimental lattice parameters and unit cell volumes of $\operatorname{Fm} \overline{3} m-(\mathrm{La}, \mathrm{Y}) \mathrm{H}_{10}(\mathrm{Z}=4), \operatorname{Imm} 2-\mathrm{YH}_{7}(\mathrm{Z}=2)$, and Cmcm- $\mathrm{LaH}_{3}(\mathrm{Z}=4)$ are given below:

| Fm $\overline{\mathbf{3}} \boldsymbol{m}$-(La, Y$) \mathrm{H}_{10}$ |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| DAC | Pressure, GPa | $a, \AA$ | $V, \AA^{3}$ |  |  |
| M1 | 180 | 5.038(1) | 127.86(2) |  |  |
| M2 | 180 | 5.026(1) | 126.98(2) |  |  |
| SL1 | 180 | 5.031(1) | 127.32(1) |  |  |
| SL3 | 170 | 5.071(1) | 130.40(1) |  |  |
| Imm2-YH7 |  |  |  |  |  |
| DAC | Pressure, GPa | $a, \AA$ | $b, \AA$ | $c, \AA$ | $V, \AA^{3}$ |
| M1* | 166 | 3.29(4) | 3.33(6) | 4.68(7) | 51.50 |
| SL3 | 170 | 3.303(1) | 3.322(2) | 4.672(2) | 51.25(2) |
| M1 | 180 | 3.279(2) | 3.305(2) | 4.641(2) | 50.30(1) |
| Cmcm-LaH3 |  |  |  |  |  |
| DAC | Pressure, GPa | $a, \AA$ | $b, \AA$ | $c, \AA$ | $V, \AA^{3}$ |
| M1 | 180 | 2.791(4) | 10.492(5) | 2.657(3) | 77.83(2) |
| SL3 | 170 | 2.737(2) | 10.507(3) | 2.727(2) | 78.44(3) |

*Taken from previous investigation of Y-H system.

Conclusion: within this project, we were able to synthesize a ternary fcc lanthanum-yttrium superhydride (decahydride) $\mathrm{La}_{3} \mathrm{YH}_{40}$, in which about $25 \%$ of La atoms were replaced by Y atoms without changing the cubic structure of the hydrogen sublattice. The latter explains the high-temperature superconductivity observed for the synthesized samples.
